This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and HindIII sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame.

The full length coding region of the B subunit or monomer of VEGF is determined from four sets of overlapping cDNA clones. Degenerate oligo. primers based on the amino acid sequences from polypeptide L50 are used to PCR amplify the central region of the cDNA for VEGF AB, B monomer. A

and

Vascular endothelial cell growth factor sub-units - which stimulate vascular endothelial cell growth, used for inducing tissue repair a

                                                      Ø
                                                                                                                                                                           9
single band migrating at 108 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (pYG) was used to design antisense and sense PCR primers to amplify the 5, and 3' ends of the cDNA. These 5' and 3' clones are denoted p5V2 and p3V2 respectively. The entire base sequence for the 158 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous E subunit are shown in AAQ28955 and AAQ28956. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             420
                                                                                                                                                                                                              This is the nucleotide sequence of a 158 amino acid residue B subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF C subunit amino acid sequence AAY57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or BC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                     subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           477

                                                                                                                                                                                                                                                                                                 The present invention is concerned with the human vascular endot growth factor (VEGF) C subunit. VEGF is a vascular endothelial c mitogen and can be used to promote vascular development and repasubunit may exist as a homodimer or a heterodimer with the VEGF subunit. VEGF can be used in the treatment of wounds of mammals, artificial blood vessels with vascular endothelial cells, in the production of artificial blood vessels and to induce tissue repa

Also disclosed as new are rat VEGF-A, -B and C subunit cDNAs and proteins. The method and VEGF (a mitogen) are useful in inducing vascular or tissue development and repair. The present sequence encodes a rat VEGF subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

The reduced and carboxymethylated protein eluted as two peaks at approx. 23 and 25 ml that were of approx. equal area as determined by monitoring absorbance at 210 nm. Samples of the two protien subuntits isolated after reduction and carboxymethylation were each applied to polybrene-coated glass fiber filters and their N-terminal sequences were determined. The peak of absorbance eluting at approx 25 ml (A subunit) yielded an amino terminal sequence Ala Pro Thr Glu Gly Glu Gln Lys Ala His Glu Val Val Val identical to VEGF AA. The peak of absorbance eluting at approx. 23 ml (B subunit) yielded the N-terminal sequence Ala Leu Ser Ala

Gly Asn Xaa Ser Thr Glu Met Glu Val Val Pro Phe Asn Glu Val plus a nearly equal amount of a truncated form of the same sequence missing the first three residues. The missing X residue corresp. to an Asn in the cloned sequence. The A and sum of the B chain peptides were recovered in nearly equal amonunts supporting the interpretation that the two peptides combine to form an AB heterodimer in VEGF II. The form of VEGF AB mature A subunit in the heterodimer is the 164 amino acid form. The form derived from the 158 full length amino acid form. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          420
                                                                                                                                                                                                                                  The B-subunit of VEGF-II occurs in two forms; the mature protein has either 135 or 115 amino acids. The two forms are generated by alternative splicing of the mRNA transcript prior to translation. The full-length coding region of the B monomer was determined from four sets of overlapping cDNA clones. PCR primers were designed based on the amino acid sequence of a Leu C peptide (L50) and used to amplify the central region of the cDNA. A single band migrating at 108bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA and complete the full-length sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   \mathfrak{A}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a rat vascular endothelial growth factor (VEGF II) B subunit. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from AAW53639, AAW53640 or AAW53641, and a B subunit from AAW53638, AAW53639 or the first 115-135 amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue rep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGCTGCTGTGGTGACGAGGGTCTGCACTGTGTGGCGCTAAAGACAGCCAACATCACTATG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a rat vascular endothelial growth factor I (VEGF I) A subunit. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from AAW53639, AAW53640 or AAW53641, and a B subunit from AAW53638, AAW53639 or the first 115-135 amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue repair

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for stimulating angiogenesis or wound healing through vascular repair, neovascularisation or both. The method comprises administering to a patient a pharmaceutically effective amount of mammalian vascular endothelial growth factor II (VEGF-II) comprising a heterodimer of subunits A and B, or a homodimer of B subunits. VEGF-II is
                                                                                                                                                                                                                                                    477

                                                                                                                     T si
                                                                             healing through vascular repair, neovascularisation or both. The method comprises administering to a patient a pharmaceutically effective amount of mammalian vascular endothelial growth factor II (VEGF-II) comprising the heterodimer of subunits A and B, or a homodimer of B subunits. VEGF-II is useful for vascular development and repair, promotion of tissue repair, and the production of artificial vessels. The present sequence encodes

                                                                                                                                                                                                                                                                                                                                                                                                     can
                                                                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of vascular endoth growth factor II (VEGF II), and the polynucleotide sequences enco growth factor II (VEGF II), and the polynucleotide sequences enco different genes. VEGF II stimulates mitogenesis of mammalian vasc endothelial cells. VEGF II is useful for promoting tissue repair stimulating the growth of vascular endothelial cells in used for stimulating the growth of vascular endothelial cells in patient to promote vascular development and repair, or blood vess growth (neovascularisation). VEGF II can further be used to produ artificial blood vessels by treating synthetic polymeric vessels vEGF II and implanting into them into a patient. After the implant endothelial cells migrate into and grow on the artificial surface present sequence encodes rat VEGF II B subunit
                                                                                                                                                                                                                                                                       w heterodimeric vascular endothelial growth factor II comprisoubunits encoded by different genes, useful for preparing a promoting vascular or tissue repair or neovascularization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAAGTGTGGGGCCGCAGCTACTGCCGGCCAATGGAGAAGCTGGTGTACATTGC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of vascular endothelial growth factor II (VEGF II), and the polynucleotide sequences encoding it. VEGF II is a heterodimer comprising A and B subunits that are encoded by different genes. VEGF II stimulates mitogenesis of mammalian vascular endothelial cells. VEGF II is useful for promoting tissue repair and for stimulating the growth of vascular endothelial cells. VEGF II can also be used for stimulating the growth of vascular endothelial cells in a patient to promote vascular development and repair, or blood vessel growth (neovascularisation). VEGF II can further be used to produce artificial blood vessels by treating synthetic polymeric vessels with VEGF II and implanting into them into a patient. After the implantation endothelial cells migrate into and grow on the artificial surface. The present sequence encodes rat VEGF I A subunit cleavage product #2
                                                                                                                             477

                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                       Щ
                                                                                                 determined from four sets of overlapping cDNA clones. Degenerate oligo. primers based on the amino acid sequences from polypeptide L50 are used to PCR amplify the central region of the cDNA for VEGF AB,B monomer. A single band migrating at 108 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (pVG) was used to design antisense and sense PCR primers to amplify the 5, and 3, ends of the cDNA. These 5, and 3, clones are denoted p5V2 and p3V2 respectively. The entire base sequence for the 158 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous become in AAQ28955 and AAQ28956. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GGCTGCTGTGGTGACGAGGGTCTGCACTGTGTGGCGCTAAAGACAGCCAACATCACTATG

This is the nucleotide sequence of a 138 amino acid residue B subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF C subunit amino acid sequence AAY57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or BC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair

The present invention is concerned with the human vascular endothelial growth factor (VEGF) C subunit. VEGF is a vascular endothelial cell mitogen and can be used to promote vascular development and repair. The subunit may exist as a homodimer or a heterodimer with the VEGF A or B subunit. VEGF can be used in the treatment of wounds of mammals, to covartificial blood vessels with vascular endothelial cells, in the production of artificial blood vessels and to induce tissue repair or
